

Triple Bermuda

Bermudagrass Blend

VSP Triple Bermuda is a blend of Maya, Blackjack and Transcontinental; three improved varieties of seeded bermudagrasses. These three seeded varieties were selected for improved turf performance, compatibility, genetic diversity and broad adaptation. VSP Triple Bermuda will establish a superior bermudagrass turf throughout the warm season and transition zone areas normally growing the species.

Varieties:

Maya: This vigorous, medium fine-bladed cultivar adds excellent disease resistance to any warm-season blend throughout the hottest summer months. It exhibited no dollar spot (9.0 resistance score) and had less damage from Spring Dead Spot (only 5% damage) than any other variety. Maya shows remarkable cold tolerance even in cold winter areas like Virginia where it exhibited no winterkill. Maya displays very good resistance (7.3) to Take All Patch in Texas trials. It had little damage (8.0 resistance score) from mole crickets.

Blackjack: This vigorous, fine-bladed cultivar adds color and density to any warm-season blend throughout the hottest summer months. In addition, Blackjack shows remarkable cold tolerance even in cold winter areas. Blackjack provides a dense green lawn all summer long.

Transcontinental: Is a well proven variety with excellent performance and turf density. Transcontinental was developed by Pure Seed Testing, Inc and traces its origin to 13 parents, several of which came from the southwestern US. Transcontinental has consistently ranked among the best performing bermudagrass varieties in all major areas of turfgrass characteristics.

Usage:

VSP Triple Bermuda blend is recommended for southern lawns, parks, sports fields, golf fairways and roughs and wherever a high quality turf is desired. Being established from seed, it is much easier to use than the old sprigged vegetative varieties.

Establishment:

Late spring plantings are best. Plant 2 to 3 pounds of bermudagrass seed (coated seed) per 1000 square feet (1 kg/100 square meters) for new turf applications. More seed may be needed when stands are established early or late in the season to ensure full coverage. It is very important to use coated seed and cover the bermudagrass seeds with soil or mulch (1/8 to 1/4 inch) - a bare, open-to-the-air seed lying on the soil surface, with no protection from wind or dry air or hot sun, cannot be kept moist enough to germinate well since it is too hard to keep exposed seeds from drying out.

Management:

For best performance VSP triple Bermuda blend should be fed 4-6 times per year. Use a good locally advised fertilizer that feeds and strengthens Southern lawns to help withstand heat and drought and to help bermudagrass turf to maintain its color and beauty during the hot summer months.

Features

- Varieties with proven performance
- Exceptional heat and remarkable cold tolerance
- Excellent density
- Broad adaptation

Uses

- Southern lawns
- Parks
- Sports fields
- Golf fairways
- Golf roughs

Seeding Rates

- New Turf
2 - 3 lbs (coated)/1,000 sq ft

Establishment

- 4 - 6 treatments per year of locally advised fertilizer
- Regular and deep watering during summer months
